# Superstore Sales Analysis Project

From Messy Data to Dashboard

## Overview

This project demonstrates an end-to-end retail sales analysis workflow using Excel and Power Query. A raw transactional dataset was cleaned, transformed, analysed, and visualized to produce an interactive dashboard highlighting sales, profitability, and transaction trends.

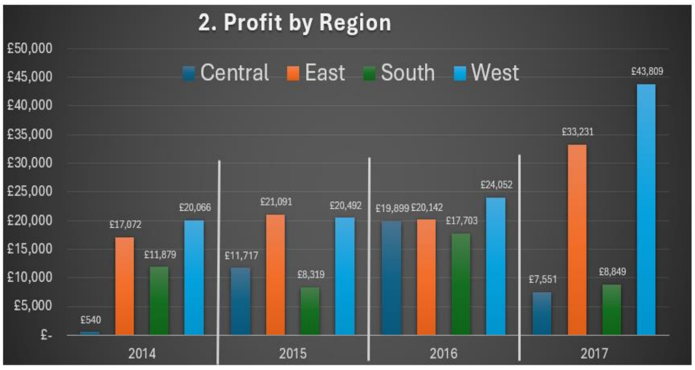
## Project Objective

The objective of this project was to transform a raw retail sales dataset into a clear and reliable analytical dashboard capable of communicating trends in sales performance, profitability, regional performance, and transaction outcomes.

## Workflow

- Data cleaning and validation
- Feature engineering
- PivotTable analysis
- Dashboard development
- Reflective workflow evaluation

## Dashboard Preview



**Key Insights - Sales & Profit by Category**

- Technology has delivered the highest sales and yielded the highest profits.
- Furniture generates low profits relative to revenue.

**Key Insights - Profit by Region**

- The East and West regions are consistently the top two profitable regions.
- The West region outperformed the East region each year

## Repository Contents

1. **Source Data**
   - Contains the original dataset in CSV file format
2. **Excel Workbook**
   - Contains the Excel workbook with imported raw data, cleaned data, PivotTables, and the dashboard
3. **Project Summary**
   - Contains the basic summary document
4. **Project Reflections**
   - Contains the Lessons Learned Presentation (PowerPoint file) and a Detailed Lessons Learned document

## Key Lessons Learned

- Effective data cleaning improves analytical reliability and downstream interpretation
- Structured investigation techniques are more scalable than manual inspection of large datasets
- Feature engineering can reveal relationships that may not be visible in raw transactional data
- Dashboard design requires iterative refinement to improve communication clarity
- Analytical workflows should be guided by business questions and intended insight
